FOR IMMEDIATE RELEASE

Ares Armor Announces the Online Availability of Custom Kydex
Positive everyday carry industry impact of a flat rear panel on custom holsters and magazine pouches.

Oceanside, CA – Custom Kydex Online – Ares Armor announces the online availability of Custom Kydex, supplying purpose built holsters and magazine pouches for everyday carry (EDC) and full spectrum (FS) consumer use.

Positive Customer Impact with a Flat Rear Panel
The Ares Armor brand, everyday carry holster line is constructed from .060 Kydex brand thermoplastic. The use of a .060 material thickness has shown to be incredibly durable and capable of handling the requirements of the concealed carry user. Unlike the typical book pressed Kydex, Ares Armor brand Kydex is vacuum formed. This method provides superior definition and increased surface contact retention; in comparison to conventional methods producing a distinct retention characteristic that most shooters prefer to other styles of holster forming. Additionally, the use of vacuum forming produces one of the most notable features, a flat rear panel. This feature provides an ideal mounting surface between the holster and the customer's belt line.

"The Custom Kydex EDC line is considerably smaller than any other Kydex kit on the market. This attribute provides a considerable advantage in terms of concealment as well as comfort," Jerry Sparks, Custom Kydex Engineer.

Custom Kydex Availability
